Subject: Phase III Plan comments
Date: Tuesday, July 07, 2015 11:25:21 AM

Good Morning Mike – Per Pat’s request, here are our comments for the Phase III and Oil Sampling plan. You and I have talked about most of these but please let me know if you have any questions. I will remain at the Command Center until this document is finalized so please let me know if I can assist you.

- Would like to see language to the effect that RP activities will be coordinated with their Env Unit Lead (assume this to be Wade) and add this to both documents
- For the Phase III Plan – need to get consensus from all regarding what constitutes an above normal tide event or a significant storm. These may mean different things to different people. You and I discussed some proposed language and I think that will be sufficient
- For OSPR / USCG samples for separate incidents –request that results be shared with UC until phase Iii completed
- For the Overview Oiling Assessment plan - Fresh oil will be targeted and if more than one type of material is found, care will be taken to get rep samples of each type based on visual characteristics and location on shoreline – main point to communicate is to make sure it is clear to all teams that the target is to sample fresh oil along the shoreline that may have been recently deposited. I believe it is clearly understood, just may need some clarification among teams.

Thanks for the opportunity to comment and I look forward to assisting you.

Regards,

Tre' Wharton
